

EXTENDABLE ARM FOR A MOTOR VEHICLE

ABSTRACT

An extendable arm that extends from a police vehicle towards a pulled over vehicle. The arm allows for two-way communication or document transfer. The police officer can position the extendable arm while seated in the vehicle. The extendable arm includes a main shaft having first and second opposed ends. The first end is pivotally attached to the vehicle. A telescoping assembly extends from the second end. The assembly has a free end that extends and retracts away from and towards the main shaft. The free end can have an accessory mounted thereon, such as a two-way audio visual camera, or a container for the retention of driver's licenses. During operation the distal end can be positioned adjacent the driver's window or the police officer's window. The free end is retracted, and the shaft is placed in a stowed position adjacent the motor vehicle when not in use.
